

Typical experimental workflow

Example of CK module **"program"**
(unified dict/JSON API)

```
import ck.kernel as ck
```

```
def compile(i):
```

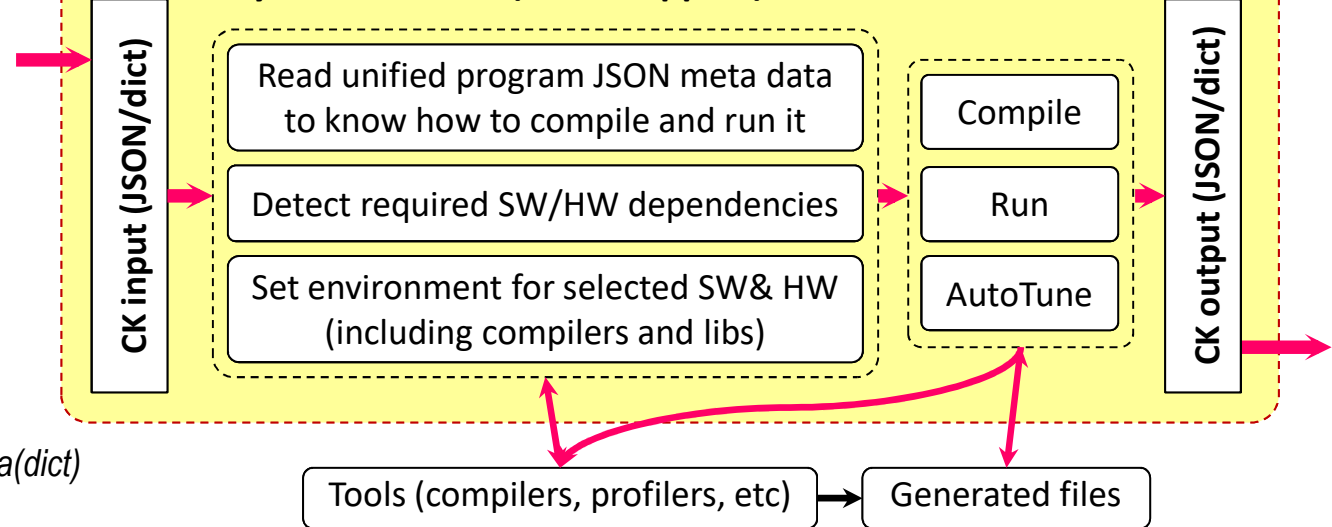

```
    # Process CMD
    prog=i.get('data_uoa',")
    flags=i.get('flags',")
    speed=i.get('speed',")
```

```
    # Get program path, UID and meta(dict)
    r=ck.access({'action':'load',
                  'module_uoa':'program',
                  'data_uoa':prog})
```

```
    if r['return']>0: return r
    path=r['path']
    uid=r['data_uid']
    meta=r['dict']
```

```
    ...
    return {'return':0}
```

CK Python modules (tool wrappers) with a unified JSON API

ck – simple command line front-end to manage CK repositories,
call CK modules, abstract tools and unify input/output

```
ck compile program:cbench-automotive-susan --speed --flags=-O3 ...
```

```
ck run program:cbench-automotive-susan
```

```
ck autotune program:cbench-automotive-susan
```
