

## Typical experimental workflow

# Example of CK API (**program module**)

```
import ck.kernel as ck
```

```
def compile (i)
```

```
    # Process CMD
    prog=i.get('data_uoa',"")
    flags=i.get('flags',"")
    speed=i.get('speed',"")
```

```
    # Get program meta and
    path
    r=ck.access({'action':'load'
```

```
# ck – simple command line front-end to manage CK repositories,
#   call CK modules, abstract tools and unify input/output
ck compile program:cbench-automotive-susan --speed --flags=-O3 ...
ck run program:cbench-automotive-susan
ck autotune program:cbench-automotive-susan
```

```
,
'module_uoa':program',
'data_uoa':prog})
    if r['return']>0: return r
    meta=r['dict']
    path=r['path']
    ...
```
